

Smallest Civic Signal Test

Can a verified, data-derived need improve how a local office understands constituents?

PARADOX

Representatives must interpret imperfect signals to represent people. But asking constituents to speak up more shifts the burden of representation back onto them.

PROBLEM

The office's sensing system can be noisy: surveys, meetings, emails, and advocacy may overrepresent the loudest voices, organized interests, and people with time to participate.

THE TEST

One constituent • one data source • one need • one local office

Ask whether the resulting signal is more accurate and easier to use than ordinary outreach.

WHAT WE LEARN

Measure: constituent effort ↓ • staff interpretation effort ↓ • information quality/usefulness ↑

Next iteration: improve data sources, verification language, and office-ready format; then test whether many verified signals reveal patterns the office currently misses.

Falsifiable question: Can personal data + explicit consent produce a civic need that is more useful than ordinary outreach?
